

## Projections of GHG emissions — outlook from National Communications under UNFCCC

[REMOVE](#) [1]

This indicator illustrates the projected trends in anthropogenic greenhouse gas emissions in relation to the Kyoto Targets. Greenhouse gas emissions (total) refer to the sum of carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>), nitrous oxide (N<sub>2</sub>O), perfluorocarbons (PFCs), hydrofluorocarbons (HFCs) and sulphur hexafluoride (SF<sub>6</sub>), weighted using their 100-year global warming potentials. National totals exclude emissions from natural resources and international bunker fuel emissions.

The indicator also provides information on emissions from the main greenhouse gas emitting sectors: energy supply and use (including energy industry, fugitive emissions, energy use by industry and by other sectors); transport; industry (processes); agriculture; waste and other (non-energy).
